

# Introduction

# Table of Contents

**Funktion** is an open source event driven lambda style programming model designed for [Kubernetes](#).

Funktion supports over 200 of different [event sources and connectors](#) including most network protocols, transports, databases, messaging systems, social networks, cloud services and SaaS offerings.

In a sense funktion is a [serverless](#) approach to event driven microservices as you focus on just writing simple *functions* in whatever programming language you prefer, then **funktion** and Kubernetes takes care of the rest. Its not that there's no servers; its more that you as the funktion developer don't have to worry about managing them!
