Introduction

Table of Contents

Funktion is an open source event driven lambda style programming model designed for Kubernetes.

Funktion supports over 200 of different event sources and connectors including most network protocols, transports, databases, messaging systems, social networks, cloud services and SaaS offerings.

In a sense funktion is a serverless approach to event driven microservices as you focus on just writing simple *functions* in whatever programming language you prefer, then funktion and Kubernetes takes care of the rest. Its not that there's no servers; its more that you as the funktion developer don't have to worry about managing them!
